MAREDO GT300 VibeShoe-Roller

- The most consistent greens 'roller' in the market
- Regular green rollers tend to push material forward and create a 'wave shaped surface' But the six feet of the **GT300** push uneven surface vertically down and leave a way more consistent surface
- The **GT300**'s vibration makes it very suitable to use in combination with topdressing. The vibration makes the sand drop into the turf without dragging it across the surface

The **GT300** can also be used to 'vibrate' topdress material into greens. Thanks to the vibration, the sand easily drops down.

Increase STIMP values and ball roll consistency on greens with the **GT300**

Impact can be set by adjusting the **GT300's** front roller

Why use the **MAREDO GT300 VibeShoe-Roller?**

The Stimp value and consistency of ball roll on greens is an incredibly important issue. Golf players will immediately notice any changes in the speed of the greens. Because of this fact it is important to roll greens regularly. Many superintendents are still used to use round rollers to increase the speed of the greens. Unfortunately round rollers always tend to push material forwards. Once a roller has pushed enough material out in front of the roll it will roll over it. This will generate a wave shape in the green.

MAREDO took the challenge to find a solution for this problem and designed the **GT300**. The **GT300** has six 'shoes'. These shoes make a rolling movement. Not only will they leave a very smooth surface, the **GT300** is also way more consistent than a regular roller. It is the same method as repairing a pitch mark with your own foot. So stop creating wave patterns in your greens and start with real rolling with the **MAREDO GT300 VibeShoe-Roller!**
